

AMENDMENTS TO THE SPECIFICATION

Page 4, amend the last paragraph (bridging pages 4 and 5) to read:

As can be most clearly seen from Fig. 6, the fan 21 is mounted on the top of the radiator 22 with the blades 211 at an inclined position relative to the top of the radiator 22, so that the blades 211 face toward side surfaces 221a of the radiation fins 221. Heat generated by the electronic element 23 during operation thereof is transferred to the radiation fins 221 of the radiator 22. Since the blades 211 of the fan 21 are directly faced toward the side surfaces 221a of the radiation fins 221, airflows produced by the rotating fan 21 are ~~kept blown toward~~ directed against the side surfaces 221a to more quickly dissipate the heat transferred to the radiation fins 221. Therefore, the fan 21 with inclined blades 211 enables the cooling fan of the present invention to have ~~increase~~ increased efficiency in carrying away heat produced by the electronic element 23 and transferred to the radiation fins 221.

Page 6, amend paragraph 1 to read:

Please refer to Fig. 9. Heat generated by the electronic element 33 during operation thereof is transferred to the radiation fins 321 of the radiator 32. Since the blades 311 of the fan 31 are directly faced toward the side surfaces 321a of the radiation fins 321, airflows produced by the rotating fan 31 are ~~kept blown toward~~ directed against the side surfaces 321a to more quickly dissipate the heat transferred to the radiation fins 321. Therefore, the fan 31 with inclined blades 311 enables the cooling fan of the present invention to have increase efficiency in carrying away heat produced by the electronic element 33 and transferred to the radiation fins 321.
